Missing State Rate

Data Governance Notes:

Complaint ID is used as the unique transaction key for complaint-level reporting. Category labels were standardized to ensure consistent aggregation across visuals. Missing state values are retained and classified as "Unknown" to maintain transparency around data completeness. Submission channel is 100% Web, so it is monitored as a dataset characteristic rather than a key segmentation field. Complaint volume is concentrated around 2019, which should be considered when interpreting trend patterns. QA summary tables were used to validate aggregate complaint counts against the main fact table.

Data Quality Control Summary

Check Area	Status
Complaint ID uniqueness	Passed
Missing state handling	Monitored
Date coverage	Passed
Submission channel variation	Limited

Late Response Rate

25.5%
Complex Narrative Rate

Interpretation Note:

Key Influencers highlights factors associated with high-risk complaints, not causal drivers. High risk is defined using late response indicators and narrative complexity. The results suggest that complex narratives, recurring issues, and high-volume companies should be prioritized for risk review.
